

Process Flow

AS-IS Process (Current State)

Current Workflow

1. The patient contacts the hospital by phone to book an appointment.
2. The receptionist manually checks the doctor's availability.
3. Appointment details are recorded in spreadsheets or manual registers.
4. The patient visits the hospital on the scheduled date.
5. The receptionist searches for the patient's records from multiple sources.
6. The doctor reviews the available information and conducts the consultation.
7. Billing is generated manually and payment is collected.

Key Challenges

- Appointment scheduling is handled manually, resulting in inefficiencies.
- Doctor availability is not visible in real time.
- Patient data is stored across multiple systems, leading to duplication and delays.
- There are no automated appointment reminders, increasing the likelihood of missed appointments.
- Billing and insurance processes are disconnected from the appointment workflow.
- Manual processes increase administrative effort and the risk of human error.
- Manual processes leave no record of who accessed or modified patient data, creating compliance and security risks.

TO-BE Process (Future State)

Proposed Workflow

1. The patient registers through the online portal.
2. The patient logs in and accesses the appointment management system.
3. The patient selects the required department and doctor.
4. The system displays real-time doctor availability.
5. The appointment is booked instantly and confirmation is generated.
6. Automated SMS and email reminders are sent before the appointment.
7. The doctor accesses the patient's medical history and records through the system.
8. Consultation details are updated digitally.
9. Billing is generated automatically and integrated with insurance claim processing.
10. Reports and records are stored centrally for future access.

Expected Benefits

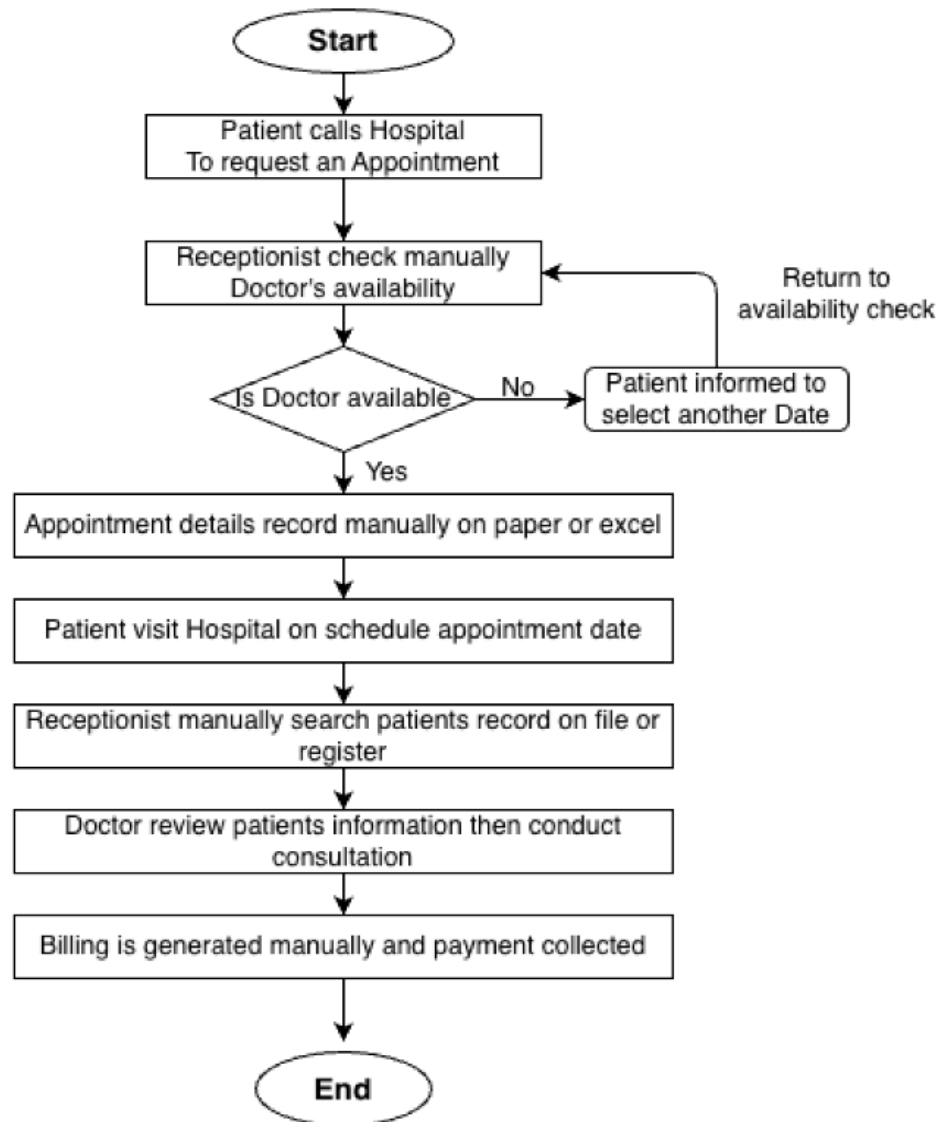

- Faster appointment scheduling and reduced waiting time.
- Improved visibility of doctor availability.
- Centralized patient records and better data accuracy.
- Reduced manual effort and operational costs.
- Improved billing and insurance processing efficiency.
- Enhanced patient experience through automation and self-service capabilities.
- Role-based access control and audit trail ensure patient data privacy and regulatory compliance.

AS-IS vs TO-BE Comparison Table

Area	AS-IS	TO-BE
Appointment Booking	Phone call and manual register	Online self-service portal
Doctor Availability	Checked manually by receptionist	Real-time visibility on system
Patient Records	Multiple scattered sources	Single centralized digital record
Appointment Reminders	None	Automated SMS and email
Billing	Manual calculation	Auto-generated with insurance link
Data Security	No audit trail	Full audit log with role-based access
Patient Experience	Long wait, manual process	Fast, digital, self-service
